

PROFESSIONAL SERVICES FOR STORAGE PERFORMANCE VALIDATION

Exceeding expectations. Accelerating ROI.

The Load Dynamix professional services team has the expertise to make networked storage testing simple and cost effective for technology vendors.

Test Offerings

We provide QA and development teams a variety of custom test offerings including test conversion and tuning for their specific environment.

Test Creation

Load Dynamix will develop tests specifically for customers' device(s) under test. We also automate tests and integrate them into your automation framework. We can create a full range of tests including:

- Functional,
- Load / Stress, and
- Performance / benchmarking.

Test Conversion

Load Dynamix offers test conversions for customers who want to convert and run their existing suite of tests in the Load Dynamix environment. We analyze the existing test suite, develop equivalent tests, and integrate them into the automation framework.

Test Tuning

Test tuning services are available for customers running tests in the Load Dynamix environment, but not generating the needed load. Load Dynamix experts analyze the tests and implement improvements to more effectively stress the device(s) under test. Test tuning discovers the true product performance limits in the most effective and efficient way possible.

“ The 3-day training was very in-depth, which made it easy to see all the powerful features of the Load Dynamix product.

Testing Services

For companies who don't own a Load Dynamix solution, but need a networked storage system evaluation, we offer testing services. The offering is ideal for validating a storage purchase or understanding the capacities of an existing storage system; and especially useful for companies who don't possess storage testing expertise. Load Dynamix develops the test plan, executes the tests, and delivers a report with detailed analysis and recommendations.

Load Dynamix Professional Services are custom quoted — we'll create the right mix of services, tailored to your needs.

Education Offerings

The education component of Load Dynamix services helps customers perform test development, test execution, results analysis, troubleshooting, and test automation. Hands-on training means better test results faster, thanks to optimum use of the Load Dynamix tools.

3-Day Quick Start

The QuickStart training is for new customers who want to accelerate the integration of Load Dynamix products into their testing process. Students will gain a basic understanding of the Load Dynamix appliance and the Test Development Environment (TDE) as well as begin working with tests.

The 3-day onsite program includes classroom-style training on test development, test execution, results analysis, troubleshooting, and automation (including labs).

Training objectives include having the ability to:

- Run test in the Load Dynamix product,
- Develop new tests, and
- Convert any desired test suites into the Load Dynamix product.

The QuickStart training is designed for up to 10 participants.

Custom Training

Load Dynamix offers custom training classes from basic to advanced performance validation topics. Custom trainings are available in flexible time increments — ideal for customers who can't dedicate a block of training days away from their busy schedules.

The Load Dynamix team possesses deep domain expertise and has built a product that solves new infrastructure problems that legacy technologies can't handle.
